

## MOVEIT EZ: SECURE FILE TRANSFER CLIENT FOR AUTOMATED, SCHEDULED TRANSFERS

Web browsers are excellent end-user clients for securely exchanging files with a MOVEit DMZ server, but browsers do not do automated, scheduled transfers — which is why we developed MOVEit EZ. This Windows-based file transfer client is EZ-to-install, EZ-to-use, EZ-to-support — and very secure. EZ is intended to automatically transfer files on a scheduled basis to and from a single MOVEit DMZ. This document provides a functional overview of the MOVEit EZ software from Ipswitch File Transfer.

MOVEit EZ is designed for quick and easy installation. It comes with configuration settings that work ‘as is’ in most situations, but can be pre-configured and/or re-branded for custom use.

EZ can be run in the foreground or as a service. An EZ icon in the Windows system tray blinks and changes to alert the user to the status and outcome of file transfers.

EZ can manage as many as fifteen automated file transfer tasks, each with its own schedule and set of rules for handling files. Each can be used to upload or download files between one or more local folders and one or more folders on a MOVEit DMZ Server. Files are transferred after they appear in the appropriate folder. There are no limits on the number, type, or size of the files sent, and no need to create, modify or use any batch files or scripts.

EZ tasks can also be used to automatically download updated EZ versions and configurations from a MOVEit DMZ, and upload to it any EZ-generated update logs and/or transfer error logs.

### TECHNICAL SPECIFICATIONS

- HTTPS-based transfers via a single firewall port (443)
- NIST FIPS 140-1 validated 128-bit SSL (TLS) encryption
- Up to 15 separate automated upload or download tasks
- Built-in task scheduling
- Automatic zlib compression
- Automatic retry and resume of transfer tasks
- Validates X.509 server authentication certificates
- Proxy server support
- SHA1 file integrity checking
- User-oriented transfer log
- Support-oriented debug log, transfer error log, and installation/update log
- ISO-Latin-1 character support

### SYSTEM SPECIFICATIONS

- Runs on Windows 2003, XP, 2000, 98, 95 and NT 4.0
- Runs as a service on Windows Vista Business Edition, 2003, XP, 2000 and NT 4.0
- Runs under EMC VMware EXS and Microsoft Virtual Server
- Requires libraries installed by Internet Explorer v.5.0 or later

Each file moved between EZ and a MOVEit DMZ is integrity checked before and after being sent — a security ‘best practice’ required by GLBA, HIPAA, PIPEDA, the PCI DSS, and SOX. Check results are logged by MOVEit DMZ and used with related authentication and authorization data to provide end-to-end file Non-Repudiation (the ability to prove who sent and who received a file, and that the file sent and received are identical). Together with their automatic retry and resume capabilities, EZ and MOVEit DMZ are able to provide file Guaranteed Delivery.

MOVEit EZ moves files securely using firewall-friendly HTTPS, which communicates through a single firewall port that is open by default (eliminating the need to open any additional ports). Everything EZ sends (usernames/passwords and file contents) is protected in transit by industry-standard SSL (TLS) encryption, and all encryption/decryption is done without user involvement.

MOVEit EZ is an excellent choice when you require secure file transfer with minimal user involvement. Technical, licensing, pricing, and evaluation information is available directly from Ipswitch.
